This printer demonstrates to you its best execution and high caliber of printing occupation to enable you to complete it effectively and flawlessly with no troubles. Subsequently, you won't lament in the wake of purchasing and bringing this printer at your working environment since it creates best printing outcomes at whatever point you utilize this printer. On the off chance that you are giving careful consideration to the speed of this printer when it is all the while, at that point you will find that this printer has quick speed which implies that you will get the printing rapidly. The printer can create for around 4 to 5 pages for every minutes in printing 8 x 10 hued photographs and 7 to 8 pages for every minutes for 11 x 14 photographs.

This speed is sufficiently quick to deliver such an appealing and clear photograph pictures for you. This printer can be your wagers accomplice when you are attempting to print a few records at working environments. The Canon PIXMA Pro9500 Mark II is a sort of photograph inkjet printing gadget that you can consider when you are searching for the best help for your photographical business. This specific printer will have the capacity to demonstrate to you the best execution that can make your photograph printing work complete and in addition conceivable. The exception is the ink. Its just to make the Pro9500 a very reliable choice for a professional or severe beginner photographer, hoping you have the extra money to pay. The ink for this printer made around an eightcolor ink system, with cyan, yellow, magenta, black, light cyan, light magenta, red, and green inks. The latest two inks are intended to increase the range of colors the printer can print associated

with printers with just four or six ink colors. The two black cartridges deliver the printer both a matte black for nonglossy paper and a photo black for glossy paper. The gray cartridge gives it much simpler to print blackandwhite photos with grays that shade smoothly. All of those things make the printer of interest to everyone who prints monochrome photos. Thats still less than half as fast as the PIXMA Pro9000. Colour accuracy and contrast are compelling on matte photo media, with real output for landscapes and portraits. Click Next, and then wait while the installer draws out the data to get ready for installment on your computer or laptop. In Windows Update, update the OS and Internet Explorer to the latest version. If the printer driver is installed in Windows 8, and if Windows 8 is upgraded to Windows 8.1 while keeping the printer driver installed, Enable bidirectional support in the printer properties may be deselected, disabling detection of the ink level, etc.

Reinstall the printer driver after upgrading to Windows 8.1 and Enable bidirectional support is selected. Canon PIXMA PRO10S is taking Canon to another level of printing. Just like the rest of the Canon printers, this inkjet photo printer is also armed with Canon FINE technology that allows the consumers to produce beautiful outputs. The more fascinating about this device is because this printer is prepared with ten different tanks of color palettes. Now you can deliver colorful images without worrying about the offensive output. Those colors are photo black, matte black, grey, cyan, photo cyan, magenta, photo magenta, yellow, red, and chroma optimizer to smoothen your output. This printer is also using Canon LUCIA ink system that will preserve your images even better. The four pl minimum droplet size serves you with its best performance as well. Find out more. Okay, thanks. Canon claims the Mark II is 1.5x faster than its predecessor.

Heres what weve discovered. Three black inks gray, black and matte black enhance the density range black and white printing. Canon claims prints have image permanence ratings up to 100 years on display not stored in the dark. The printer provides a rear photo tray for standard weight sheets and a front tray feeding mechanism for heavier art paper. No Ethernet or FireWire. OneYear Tollfree technical phone support Canon does not include one. A printing surface is sized on what are often 100 percent rag sheets to receive the ink. They offer a different look for you images, mimicking everything from black and white printing to canvas. The Pro9500 Mark II can handle single sheets up to 1.2mm thick in the front tray. Fine arts papers sacrifice that range for special effects that may make more of an impression for some images. Basis Weight or Substance is the weight in pounds of a ream of the paper 500 sheets in a standard size. When a paper is described as 25 lb., it means a ream weighs 25 pounds. Simple as that. You should always let a new package of paper acclimate to your environment. Printers need a warm room to function properly and your paper should sit in that warm room with your printer for about two days before you try using it. General recommendations are 6075 degrees F and 40 to 60 percent humidity if youre comfortable, the papers comfortable. Some heavily textured papers must be brushed free of paper lint before they go through your printer. Any sheets you stack should be fanned to separate them and get some air between them, avoiding doubles and making feeding more reliable. Swellable sheets will swell on contact with the moisture of your fingertips and porous sheets will actually draw that moisture in. The Pro9000 Mark

II dye option or the PRo9500 Mark II pigment option raises the question of how to evaluate that choice. But youd still be sitting there in the best of all possible worlds wondering what the advantages are of each. Lets look.

Neither light nor ozone gas fading bother them nearly as much as dyes. And despite the advances made by dye inks that bring their dark storage longevity well into three digits, pigments still do better when displayed. More typically, the glassframed print longevity is 104 years for Semigloss and 95 years for Photo Rag, but 190 years for both when framed with a UV filter. Dyes have to dry before you can evaluate the image. Delivered in an ink vehicle that swells the gel layer of the photo paper on contact, dyes change appearance as the vehicle evaporates and the gel shrinks back down. For one thing, pigment particles are larger than dye molecules and scatter more light. They deliver a smaller color gamut than dyes and are noticeably less intensely colored with less deep blacks than equivalent dye images. To avoid that, pigment printers flush the head much more frequently. With expensive pigment ink. The effect, commonly called bronzing, is almost like a solarization of the image. To avoid the problem, some manufacturers lay a Gloss Optimizer over the image so light is reflected uniformly. Other manufacturers simply recommend not using a swellable glossy paper. Pigments have a hard time on glossy surfaces, where uniformity is difficult to achieve. Two ink colors might match under one light source, for example, but be easily distinguished under another. Or, more commonly observed, the print will look fine under fluorescent lighting and appear with a color cast in sunlight. This is not quite the same issue as the gloss problem, although metameric failure can be noticed just by changing the angle of view of a print, too. Generally, this problem has become far less of an issue than when pigments were first offered. But there is no workaround you can employ. The Canonsupplied ICC profiles for the Pro9000 Mark II dye printer, for example, include all of the companys swellable sheets in addition to the fine arts papers.

But the pigmentbased Pro9500 Mark II offers far fewer options. There isnt a high gloss solution for pigmented inks, although printing on porous glossy paper is as good as it gets. Porous papers with dyes do very poorly for longevity, however, primarily from gas fading. The only difference, from the outside, is the color of the plastic body. The grays of the Pro9000 become the black of the Pro9500. And the PIXMA badge on top is gold on the Pro9500 where it is silver on the Pro9000. Wheels at each rear corner make it easy to reposition the printer. Theres no fancy touch screen or menu system on the Pro9500 Mark II. Its designed to do one thing well. The i9900 had a FireWire port that we miss on the Pro9500, which connects only through its USB 2.0 HiSpeed connection or the PictBridge port in the front. The rollers in the back of the unit made it very easy to navigate the printer to the edge of our utility table. And Canons cartridge design makes it a snap to install the ink cartridges. Ten, to be precise. Profiles for all the fine arts papers were provided Museum Etching, Photo Rag, Premium Matte and Semigloss as well as Canons Pro Platinum paper, although as a swellable glossy sheet it cant be construed as a recommendation. We printed on Kodak Ultra in High Gloss with very good results. It stands to reason, after all, because these papers were designed for Kodaks pigment printers. We simply used the Platinum profile, although Kodak recommends the Photo Paper Plus Glossy or Photo Paper Pro profiles for Canon printers presumably dyebased. The first sheet repeatedly makes four forward nudges before it rolls the paper back. The second sheet seems to confirm the first sheets changes. You dont do this much, so it isnt an issue, but do allow some time for it. That includes bouts with Epson, HP and Kodak printers. The real question is whether or not its still worth the tradeoffs to go pigment with dyes having improved so much. Color was faithful using the included profiles.

The machine was quiet while printing, although it did a lot of ink mixing and flushing as pigment printers do. We encountered no jams using either the rear or front feeds. Front feeding is identical to the Pro9000 Mark II. We did misalign one sheet but carefully butting the sheet against the side guide eliminates that problem. But they were hardly worth remarking. And viewing the image

straight on, you dont see it. It takes quite an oblique angle in strong light to notice at all. And we were looking for it. But again, only at an angle, and only because we were looking for it. Swellable papers seemed to recapture their sheen by the next day but porous sheets remained a bit duller than their dye counterparts. And there is a wider color gamut on the Pro9000. So we can certainly appreciate Canons recommendation not to print on glossy with the Pro9500, although we dont think it need be religiously observed. Wider gamut on with the Pro9000 r dyes. In fact, we began wondering if the world is really a glossy or a matte place. The matte images on the fine arts papers had a richness and warmth we started to miss on the harder glossy sheets. It was almost the difference of moving from RC paper to fiber paper. Suddenly the images came alive with texture we hadnt appreciated on the glossy prints. We particularly liked Photo Rag for our black and whites. Even in large, flat, light skies there was only the effect of a watercolor wash, no dots. We had to look hard at the highlights of a very high contrast print to see any dot pattern at all. As we noted, we were able to use the glossy paper profile reliably with the Kodak porous glossy sheets. And the fine arts surfaces cover semigloss, matte, rag and heavily textured sheets. A pigment printer, after all, is built for printing on porous art paper and while the standard Canon profiles will get you close, theres nothing like a custom profile for a special paper.

One reason, of course, is the Margin 35 requirement for the heavy sheets we were using. But the mixing and flushing we constantly heard from the Pro9500 worried us that without doing anything at all, wed have empty cartridges at the end of the week. Not so. Its methodical and quick but it doesnt shake the table like some printers. Generally, expect it to take about 10 minutes or so for a 13x19 print. You will notice the mixing and flushing, but otherwise it sits silently until you give it something to do. And the soft sound of the print head traversing the width of the paper somewhat calms you down so you can bear the excitement until the print is delivered. Somewhat, yes. We do, however, make note of maintenance requirements cited in the user manuals. Ink is flushed to the blotter when you clean the print head, for example. Paper feeding was reliable if a bit burdensome for fine art papers. And Canon supplies profiles for all the papers it recommends for pigment inks. But dyes have challenged pigment sufficiently in print permanence that they remain preferred for printing on glossy sheets.
